

One-to-One Platform: App Summary

Repo source: 2025_Group14_C24071109 (Spring Boot monolith)

What it is

A server-rendered Spring Boot web app for behaviour-change coaching workflows. It supports client habit and health tracking while enabling trainers, gym admins, and super admins to manage coaching, memberships, and verification.

Who it's for

- Primary persona: a client receiving behaviour-change coaching and accountability from a trainer.
- Secondary roles in the same platform: trainer, gym admin, and super admin.

What it does

- Tracks goals, check-ins, schedules, workouts, nutrition, and day health data.
- Provides role-specific dashboards for clients, trainers, gym admins, and admins.
- Supports messaging and inbox threads, with policy checks for off-platform payment language.
- Includes trainer template libraries and trainer-to-client plan assignment workflows.
- Manages memberships, platform billing records, trainer verification, and review moderation.
- Delivers notifications with server-sent events (SSE) for near-real-time updates.
- Offers AI chat features and context-aware coaching support in chat modules.

How it works (repo-evidenced architecture)

- Single Java 21 Spring Boot 3.5.7 monolith using Spring MVC + Thymeleaf templates.
- Request flow: Browser -> Controller -> Service (business rules/access checks) -> JPA Repository -> H2/PostgreSQL -> Thymeleaf HTML response.
- Security layer: Spring Security role checks plus ownership/access guard logic in controllers/services.
- Front-end assets: Tailwind/PostCSS pipeline builds static CSS; static JS modules power interactive pages.

How to run (minimal getting started)

- Prereqs from repo config: JDK 21 and Node.js (for CSS build tooling).
- Build CSS once: npm install then npm run build:css.
- Start app: ./gradlew bootRun (defaults to SPRING_PROFILES_ACTIVE=local in build.gradle).
- Open http://localhost:8080 (local profile uses in-memory H2 and seeds SQL init data).
- Optional for AI chat: set OPENAI_API_KEY environment variable.
